

# PYTHON

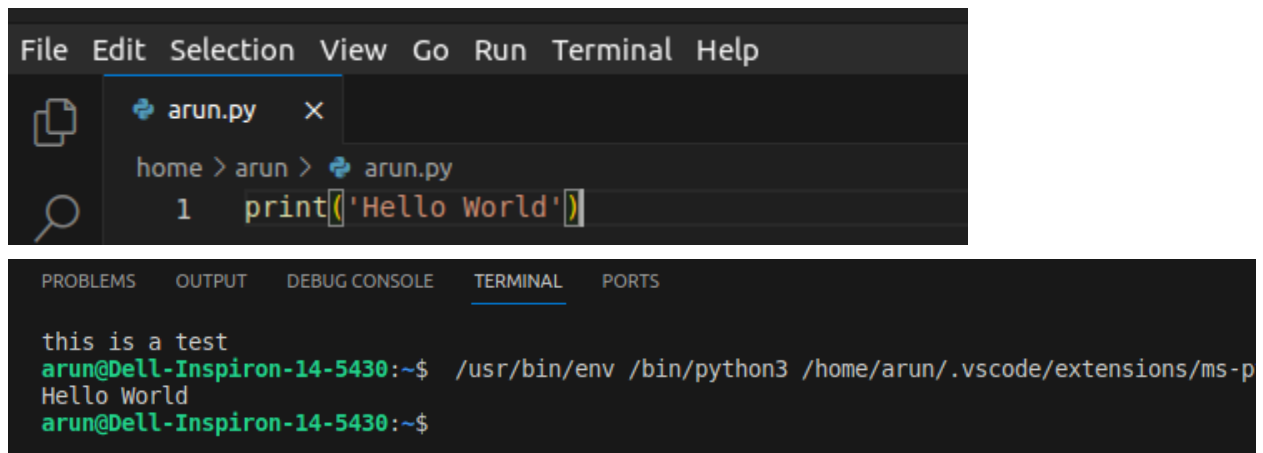

1. VS-code can be used as an interpreter for python and the file can be saved with an extension “.py”

2. First Program

print(“First Program”) --> A function to print the text written in quotes on the console.

3. To run a python file in terminal

Command: python3 file1.py(file-name)

```
File Edit Selection View Go Run Terminal Help
arun.py x
home > arun > arun.py
1 print('Hello World')

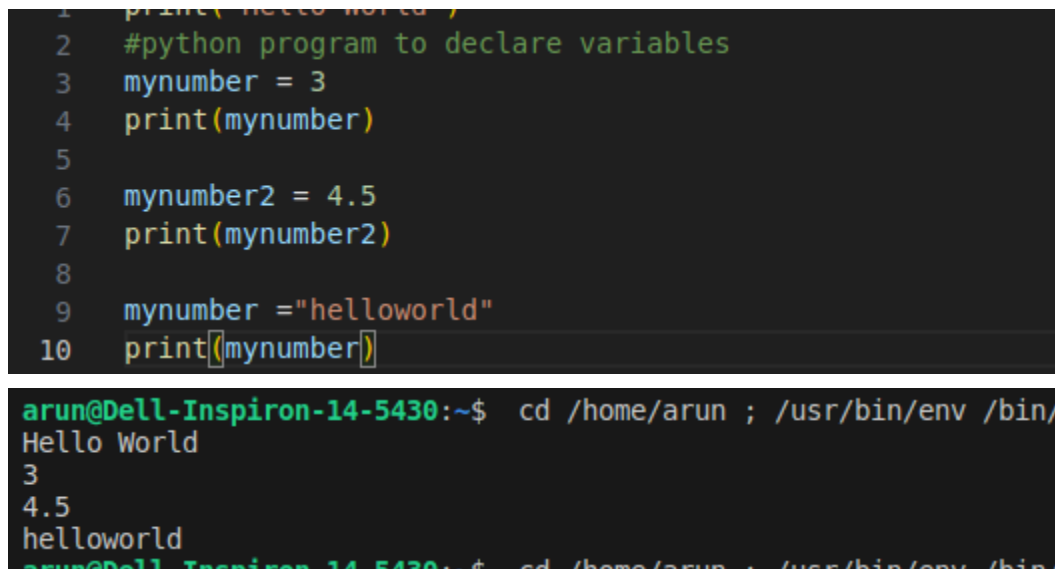

PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS
this is a test
arun@Dell-Inspiron-14-5430:~$ /usr/bin/env /bin/python3 /home/arun/.vscode/extensions/ms-p
Hello World
arun@Dell-Inspiron-14-5430:~$
```

4. Declaration --> No need to declare in Python.

myNumber = 3 --> It will take it as number

myNumber = 4.5 --> It will take it as float

nyNumber = “helloworld” --> It will take it as a string

```
1 print('Hello World')
2 #python program to declare variables
3 mynumber = 3
4 print(mynumber)
5
6 mynumber2 = 4.5
7 print(mynumber2)
8
9 mynumber = "helloworld"
10 print(mynumber)

arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/
Hello World
3
4.5
helloworld
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/
```

5. Everything is a object in Python Programming and Data types is classes with variables as Instances.

## 6. Data Types of Python:

### 1. Numeric

- a. Integer --> It contains positive or negative whole numbers (without fractions or decimals)
- b. Float --> It is specified by a decimal point.
- c. Complex Number --> It is specified as(real part) + (imaginary part)j.

```
12 #python program to demonstrate numeric value
13
14 a = 5
15 print("type of a: ", type(a))
16
17 b = 5.0
18 print("\nType of b: ", type(b))
19
20 c = 2+4j
21 print("\nType of c: ", type(c))
```

```
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin
type of a: <class 'int'>

Type of b: <class 'float'>

Type of c: <class 'complex'>
arun@Dell-Inspiron-14-5430:~$
```

- 2. Boolean --> Data type with one of the two in-built values i.e., True or False.

- 3. Dictionary --> An unordered collection of data values in key : value pair.

#### Creating a Dictionary with Integer Keys

```
Dict= {1: 'Geeks', 2: 'For', 3: 'Geeks'}
print("\nDictionary with the use of Integer Keys: ")
print(Dict)
```

OUTPUT: Dictionary with the use of Integer Keys:

{1: 'Geeks', 2: 'For', 3: 'Geeks'}

- 4. Set --> An unordered collection of data types that is iterable, mutable and has no duplicate elements. The order is undefined.

#### Creating a Set with the use of a String

```
set1 =set("GeeksForGeeks")
print("\nSet with the use of String: ")
print(set1)
```

OUTPUT: Set with the use of String:

{'F', 'o', 'G', 's', 'r', 'k', 'e'}

## 5. Sequence Type

- a. Strings --> It is a collection of characters put in a single/double quote.

### Creating a String

```
String1 ='Welcome to the Geeks World'  
print("String with the use of Single Quotes: ")  
print(String1)
```

b. List --> It is an ordered collection of data (just like arrays).

### Creating a List

```
List= []  
print("Initial blank List: ")  
print(List)
```

c. Tuple --> It is same as list but only difference is that it is immutable(cannot be changed after creation).

### Creating a Tuple with the use of list

```
list1 =[1, 2, 4, 5, 6]  
print("\nTuple using List: ")  
print(tuple(list1))
```

7. To check the data type of any value --> type()

8. Math Functions: --> Python has an in-built module that can be used for mathematical tasks.

a. math.floor() --> Rounds a number down to the nearest integer.

b. math.isclose() --> checks whether two values are close to each other or not.

c. math.isqrt() --> Rounds a square root number downwards to the nearest integer.

Many more ....

9. Operator Precedence --> It describes the order in which operations are performed.

Here,  is an arithmetic operator that subtracts two values or variables.

Operator	Operation	Example
<input type="text" value="+"/>	Addition	<input type="text" value="5 + 2 = 7"/>
<input type="text" value="-"/>	Subtraction	<input type="text" value="4 - 2 = 2"/>
<input type="text" value="*"/>	Multiplication	<input type="text" value="2 * 3 = 6"/>
<input type="text" value="/"/>	Division	<input type="text" value="4 / 2 = 2"/>
<input type="text" value="//"/>	Floor Division	<input type="text" value="10 // 3 = 3"/>
<input type="text" value="%"/>	Modulo	<input type="text" value="5 % 2 = 1"/>
<input type="text" value="**"/>	Power	<input type="text" value="4 ** 2 = 16"/>

## 10. Arithmetic Operators

Here, `-` is an arithmetic operator that subtracts two values or variables.

Operator	Operation	Example
<code>+</code>	Addition	<code>5 + 2 = 7</code>
<code>-</code>	Subtraction	<code>4 - 2 = 2</code>
<code>*</code>	Multiplication	<code>2 * 3 = 6</code>
<code>/</code>	Division	<code>4 / 2 = 2</code>
<code>//</code>	Floor Division	<code>10 // 3 = 3</code>
<code>%</code>	Modulo	<code>5 % 2 = 1</code>
<code>**</code>	Power	<code>4 ** 2 = 16</code>

## 11. Assignment Operators

Operator	Example	Same As
<code>=</code>	<code>x = 5</code>	<code>x = 5</code>
<code>+=</code>	<code>x += 3</code>	<code>x = x + 3</code>
<code>-=</code>	<code>x -= 3</code>	<code>x = x - 3</code>
<code>*=</code>	<code>x *= 3</code>	<code>x = x * 3</code>
<code>/=</code>	<code>x /= 3</code>	<code>x = x / 3</code>
<code>%=</code>	<code>x %= 3</code>	<code>x = x % 3</code>
<code>//=</code>	<code>x //= 3</code>	<code>x = x // 3</code>
<code>**=</code>	<code>x **= 3</code>	<code>x = x ** 3</code>
<code>&amp;=</code>	<code>x &amp;= 3</code>	<code>x = x &amp; 3</code>
<code> =</code>	<code>x  = 3</code>	<code>x = x   3</code>
<code>^=</code>	<code>x ^= 3</code>	<code>x = x ^ 3</code>
<code>&gt;&gt;=</code>	<code>x &gt;&gt;= 3</code>	<code>x = x &gt;&gt; 3</code>
<code>&lt;&lt;=</code>	<code>x &lt;&lt;= 3</code>	<code>x = x &lt;&lt; 3</code>

## 12. Comparison Operators

Comparison operators are used to compare two values:

Operator	Name	Example
==	Equal	x == y
!=	Not equal	x != y
>	Greater than	x > y
<	Less than	x < y
>=	Greater than or equal to	x >= y
<=	Less than or equal to	x <= y

13. Scope --> The region where a variable is accessed is the scope of that.

14. Local Scope --> A variable created inside a function belongs to the local scope of that function, and can only be used inside that function.

15. Global Scope --> A variable created in the main body of the Python code is a global variable and belongs to the global scope.

16. Global Keyword --> If you need to create a global variable, but are stuck in the local scope, you can use the **global** keyword.

17. Python Statement --> These are the whole structures which are declared.

Python Expression --> These can be assigned as a value or can be used as operands.

## PART-2

### 1. Augmented Assignment Operators -->

Here it combines the arithmetic operation with the assignment to a variable.

Operator	Example	Same As
=	x = 5	x = 5
+=	x += 3	x = x + 3
-=	x -= 3	x = x - 3
*=	x *= 3	x = x * 3
/=	x /= 3	x = x / 3
%=	x %= 3	x = x % 3
//=	x //= 3	x = x // 3
**=	x **= 3	x = x ** 3
&=	x &= 3	x = x & 3
=	x  = 3	x = x   3
^=	x ^= 3	x = x ^ 3
>>=	x >>= 3	x = x >> 3
<<=	x <<= 3	x = x << 3

2. **Strings** --> They are the operands which are assigned to variable and are surrounded by single/double quotation marks.

```
print("Hello")  
print('Hello')
```

Assigning string to a variable -->

```
a = "Hello"  
print(a)
```

Length of a string --> **len()**

Check if certain phrase or character in string -->

```
txt = "The best things in life are free!"  
print("free" in txt)
```

3. **String Concatenation** --> String concatenation means add strings together.

```
x = "Python is "  
y = "awesome"  
z = x + y  
print(z)
```

4. **Type Conversion** --> There are several built-in functions to perform conversion from one data type to another.

1	<b>int(x [,base])</b> Converts x to an integer. base specifies the base if x is a string.
2	<b>long(x [,base] )</b> Converts x to a long integer. base specifies the base if x is a string.
3	<b>float(x)</b> Converts x to a floating-point number.
4	<b>complex(real [,imag])</b> Creates a complex number.
5	<b>str(x)</b> Converts object x to a string representation.
6	<b>repr(x)</b> Converts object x to an expression string.
7	<b>eval(str)</b> Evaluates a string and returns an object.
8	<b>tuple(s)</b> Converts s to a tuple.
9	<b>list(s)</b> Converts s to a list.
10	<b>set(s)</b> Converts s to a set.
11	<b>dict(d)</b> Creates a dictionary. d must be a sequence of (key,value) tuples.
12	<b>frozenset(s)</b> Converts s to a frozen set.
13	<b>chr(x)</b> Converts an integer to a character.
14	<b>unichr(x)</b> Converts an integer to a Unicode character.
15	<b>ord(x)</b> Converts a single character to its integer value.
16	<b>hex(x)</b> Converts an integer to a hexadecimal string.
17	<b>oct(x)</b> Converts an integer to an octal string.

**5. Escaping Characters in Python** --> To insert characters that are illegal in a string, use an escape character.

Code	Result
\'	Single Quote
\\	Backslash
\n	New Line
\r	Carriage Return
\t	Tab
\b	Backspace
\f	Form Feed
\ooo	Octal value
\xhh	Hex value

## 6. String formatting in Python

There are five different ways to perform string formatting in Python

### 1. Formatting with % Operator.

a. `print("The mangy, scrawny stray dog %s gobbled down" %'hurriedly' + "the grain-free, organic dog food.")`

b. `x = 'looked'`

`print("Misha %s and %s around"%('walked',x))`

c. `print('The value of pi is: %5.4f' %(3.141592))` - Here 5.4 means 5 width and 4 decimal Places

### 2. Formatting with format() string method.

a. `print('We all are {}'.format('equal'))` -> We all are equal.

```
22 print('We all are {}'.format('equal'))
```

```
type of c: <class 'complex'>
```

```
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun/.vscode/extensions/m
```

```
We all are equal.
```

```
arun@Dell-Inspiron-14-5430:~$
```

- b. `print('{2} {1} {0}'.format('directions','the', 'Read'))` → Read the Instructions

```
print('{2} {1} {0}'.format('direction','the','read'))
```

PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS

this is a test

```
arun@Dell-Inspiron-14-5430:~$ /usr/bin/env /bin/python3 /home/arun/
read the direction
```

```
arun@Dell-Inspiron-14-5430:~$
```

- c. `print('a: {a}, b: {b}, c: {c}'.format(a = 1,b = 'Two',c = 12.3))`  
→ a:1, b: Two, c: 12.3

```
print('a: {a}, b: {b}, c: {c}'.format(a = 1,b = 'Two',c = 12.3))
```

```
print('a: {a}, b: {b}, c: {c}'.format(a = 1,b = 'Two',c = 12.3))
```

```
un.py
```

```
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/pyt
un.py
```

```
a: 1, b: Two, c: 12.3
```

```
arun@Dell-Inspiron-14-5430:~$
```

- d. `print('The first {p} was alright, but the {p} {p} was tough.'.format(p='second'))` → The first second was right, but the second second was tough.

```
print('The first {p} was alright, but the {p} {p} was tough.'.format(p='second'))
```

```
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun/.vsco
un.py
The first second was alright, but the second second was tough.
arun@Dell-Inspiron-14-5430:~$
```

- e. `print('The value of pi is: %1.5f' %3.141592)` → The value of pi is: 3.14159  
f. `print('The value of pi is: {0:1.5f}'.format(3.141592))` → The value of pi is: 3.14159

```
3
4 print('The value of pi is: %1.5f' %3.141592) |
5 print('The value of pi is: {0:1.5f}'.format(3.141592))
```

```

arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun/.vscode
un.py
The value of pi is: 3.14159
The value of pi is: 3.14159
arun@Dell-Inspiron-14-5430:~$

```

3. **Formatting with string literals, called f-strings.** – F-strings provide a concise and convenient way to embed Python expressions inside string literals for formatting.

- a. `name = 'Ele'`  
`print(f"My name is {name}.")` → My name is Ele.  
(In this code, the f-string `f"My name is {name}."` is used to interpolate the value of the name variable into the string.)

```

name = 'Ele'
print(f"My name is {name}.")

```

```

arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun/.vscode
un.py
My name is Ele.
arun@Dell-Inspiron-14-5430:~$

```

- b. `a = 5`  
`b = 10`  
`print(f"He said his age is {2 * (a + b)}")` → He said his age is 30.

```

a = 5
b = 10
print(f"He said his age is {2 * (a + b)}")

```

```

arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun/.vscode
un.py
He said his age is 30.
arun@Dell-Inspiron-14-5430:~$

```

```
c. num = 3.14159
print(f"The valueof pi is: {num:{1}.{5}}") -> The valueof pi
is: 3.1416
```

```
num = 3.14159
print(f"The valueof pi is: {num:{1}.{5}}")
```

```
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /
un.py
The valueof pi is: 3.1416
arun@Dell-Inspiron-14-5430:~$
```

#### 4. Formatting with String Template Class

```
from string import Template
```

```
n1 = 'Hello'
```

```
n2 = 'GeeksforGeeks'
```

```
# made a template which we used to pass two variable so n3 and n4
formal and n1 and n2 actual
```

```
n = Template('$n3 ! This is $n4.')
```

```
# and pass the parameters into the template string.
```

```
print(n.substitute(n3=n1, n4=n2))
```

OUTPUT: Hello ! This is GeeksforGeeks.

```
n1 = 'Hello'
n2 = 'GeeksforGeeks'

# made a template which we used to pass two variable so n3 and n4 formal and n1 and n2 actual
n = Template('$n3 ! This is $n4.')
```

```
# and pass the parameters into the template string.
print(n.substitute(n3=n1, n4=n2))
```

```
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun/.vscode/extension
un.py
Hello ! This is GeeksforGeeks.
arun@Dell-Inspiron-14-5430:~$
```

## 5. Formatting with center() string method.

```
string = "GeeksForGeeks!"  
width = 30  
  
centered_string = string.center(width)  
  
print(centered_string)
```

OUTPUT: **GeeksForGeeks!**

```
string = "GeeksForGeeks!"  
width = 30  
  
centered_string = string.center(width)  
  
print(centered_string)
```

```
netto : this is geeksforgeeks.  
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /  
un.py  
GeeksForGeeks!  
arun@Dell-Inspiron-14-5430:~$
```

## 7. Python String Index

a. `string = 'random'`  
`print("index of 'and' in string:", string.index('and'))`

OUTPUT: Index of 'and' in string: 1

### b. Python String Index() with Start Argument

```
# initializing target string  
ch = "geeksforgeeks"  
  
# initializing argument string  
ch1 = "geeks"
```

```
# using index() to find position of "geeks" starting from 2nd
index prints 8
```

```
pos = ch.index(ch1,2) -> '2' is used for slicing
```

```
print("The first position of geeks after 2nd index : ",end="")
print(pos)
```

OUTPUT: The first position of geeks after 2nd index : 8

```
string = 'random'
print("index of 'and' in string:", string.index('and'))
```

```
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3
un.py
index of 'and' in string: 1
arun@Dell-Inspiron-14-5430:~$
```

```
# initializing target string
ch = "geeksforgeeks"

# initializing argument string
ch1 = "geeks"

# using index() to find position of "geeks" starting from 2nd index prints 8
pos = ch.index(ch1,2)

print("The first position of geeks after 2nd index : ",end="")
print(pos)
```

```
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/a
un.py
The first position of geeks after 2nd index : 8
arun@Dell-Inspiron-14-5430:~$
```

### c. Python String Index() with Start and End Arguments

```
test_string = "1234gfg4321"
# finding gfg in string segment 'gfg4'
print(test_string.index('gfg', 4, 8))

# finding "21" in string segment 'gfg4321'
```

```
print(test_string.index("21", 8, len(test_string)))

# finding "32" in string segment 'fg432' using negative index
print(test_string.index("32", 5, -1))
```

OUTPUT:

```
4
9
8
```

```
test_string = "1234gfg4321"
# finding gfg in string segment 'gfg4'
print(test_string.index('gfg', 4, 8))

# finding "21" in string segment 'gfg4321'
print(test_string.index("21", 8, len(test_string)))

# finding "32" in string segment 'fg432' using negative index
print(test_string.index("32", 5, -1))

the first position of geeks after 2nd index : 8
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python
un.py
4
9
8
arun@Dell-Inspiron-14-5430:~$
```

```
d.text = "Hello Geeks and welcome to Geeksforgeeks"
substring_list = ["Geeks", "welcome", "notfound"]

indices = [text.index(sub) if sub in text else -1 for sub
in substring_list]
print(indices)
```

OUTPUT: [6,16,-1]

```
text = "Hello Geeks and welcome to Geeksforgeeks"
substring_list = ["Geeks", "welcome", "notfound"]

indices = [text.index(sub) if sub in text else -1 for sub in substring_list]
print(indices)
```

```
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun.py
[6, 16, -1]
arun@Dell-Inspiron-14-5430:~$
```

## 8. Immutability:-

Immutable → Int, float, bool, string, Unicode and tuple

```
a. tuple1 = (0, 1, 2, 3)
tuple1[0] = 4
print(tuple1)
```

→ Will throw an error stating “assignment” not supported

```
tuple1 = (0, 1, 2, 3)
tuple1[0] = 4
print(tuple1)
```

```
tuple1[0] = 4
TypeError: 'tuple' object does not support item assignment
arun@Dell-Inspiron-14-5430:~$
```

Mutable → list, dictionary, set

```
a. my_list = [1, 2, 3]
my_list.append(4)
print(my_list)

my_list.insert(1, 5)
print(my_list)

my_list.remove(2)
print(my_list)

popped_element = my_list.pop(0)
print(my_list)
print(popped_element)
```

**OUTPUT:**

```
[1, 2, 3, 4]
[1, 5, 2, 3, 4]
[1, 5, 3, 4]
[5, 3, 4]
1
```

```
my_list = [1, 2, 3]
my_list.append(4)
print(my_list)

my_list.insert(1, 5)
print(my_list)

my_list.remove(2)
print(my_list)

popped_element = my_list.pop(0)
print(my_list)
print(popped_element)
```

```
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun.py
[1, 2, 3, 4]
[1, 5, 2, 3, 4]
[1, 5, 3, 4]
[5, 3, 4]
1
arun@Dell-Inspiron-14-5430:~$
```

```
b.my_dict = {"name": "Tezz", "age": 22}

new_dict = my_dict
new_dict["age"] = 37

print(my_dict)
print(new_dict)
```

**OUTPUT:**

```
{'name': 'Ram', 'age': 37}
{'name': 'Ram', 'age': 37}
```

```

my_dict = {"name": "Tezz", "age": 22}
new_dict = my_dict
new_dict["age"] = 37

print(my_dict)
print(new_dict)

```

```

arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun/.vscode/extensions/
un.py
{'name': 'Tezz', 'age': 37}
{'name': 'Tezz', 'age': 37}
arun@Dell-Inspiron-14-5430:~$

```

## 10. Built-In Functions + Methods

<u>round()</u>	Rounds a numbers
<u>set()</u>	Returns a new set object
<u>setattr()</u>	Sets an attribute (property/method) of an object
<u>slice()</u>	Returns a slice object
<u>sorted()</u>	Returns a sorted list
<u>staticmethod()</u>	Converts a method into a static method
<u>str()</u>	Returns a string object
<u>sum()</u>	Sums the items of an iterator
<u>super()</u>	Returns an object that represents the parent class
<u>tuple()</u>	Returns a tuple
<u>type()</u>	Returns the type of an object
<u>vars()</u>	Returns the __dict__ property of an object
<u>zip()</u>	Returns an iterator, from two or more iterators

Function	Description
<u>abs()</u>	Returns the absolute value of a number
<u>all()</u>	Returns True if all items in an iterable object are true
<u>any()</u>	Returns True if any item in an iterable object is true
<u>ascii()</u>	Returns a readable version of an object. Replaces none-ascii characters with escape character
<u>bin()</u>	Returns the binary version of a number
<u>bool()</u>	Returns the boolean value of the specified object
<u>bytearray()</u>	Returns an array of bytes
<u>bytes()</u>	Returns a bytes object
<u>callable()</u>	Returns True if the specified object is callable, otherwise False
<u>chr()</u>	Returns a character from the specified Unicode code.
<u>classmethod()</u>	Converts a method into a class method
<u>compile()</u>	Returns the specified source as an object, ready to be executed
<u>complex()</u>	Returns a complex number
<u>delattr()</u>	Deletes the specified attribute (property or method) from the specified object
<u>dict()</u>	Returns a dictionary (Array)
<u>dir()</u>	Returns a list of the specified object's properties and methods
<u>divmod()</u>	Returns the quotient and the remainder when argument1 is divided by argument2
<u>enumerate()</u>	Takes a collection (e.g. a tuple) and returns it as an enumerate object
<u>eval()</u>	Evaluates and executes an expression
<u>exec()</u>	Executes the specified code (or object)
<u>filter()</u>	Use a filter function to exclude items in an iterable object
<u>float()</u>	Returns a floating point number
<u>format()</u>	Formats a specified value
<u>frozenset()</u>	Returns a frozenset object
<u>getattr()</u>	Returns the value of the specified attribute (property or method)
<u>globals()</u>	Returns the current global symbol table as a dictionary

<u>hasattr()</u>	Returns True if the specified object has the specified attribute (property/method)
hash()	Returns the hash value of a specified object
help()	Executes the built-in help system
<u>hex()</u>	Converts a number into a hexadecimal value
<u>id()</u>	Returns the id of an object
<u>input()</u>	Allowing user input
<u>int()</u>	Returns an integer number
<u>isinstance()</u>	Returns True if a specified object is an instance of a specified object
<u>issubclass()</u>	Returns True if a specified class is a subclass of a specified object
<u>iter()</u>	Returns an iterator object
<u>len()</u>	Returns the length of an object
<u>list()</u>	Returns a list
<u>locals()</u>	Returns an updated dictionary of the current local symbol table
<u>map()</u>	Returns the specified iterator with the specified function applied to each item
<u>max()</u>	Returns the largest item in an iterable
<u>memoryview()</u>	Returns a memory view object
<u>min()</u>	Returns the smallest item in an iterable
<u>next()</u>	Returns the next item in an iterable
<u>object()</u>	Returns a new object
<u>oct()</u>	Converts a number into an octal
<u>open()</u>	Opens a file and returns a file object
<u>ord()</u>	Convert an integer representing the Unicode of the specified character
<u>pow()</u>	Returns the value of x to the power of y
<u>print()</u>	Prints to the standard output device
property()	Gets, sets, deletes a property
<u>range()</u>	Returns a sequence of numbers, starting from 0 and increments by 1 (by default)
repr()	Returns a readable version of an object
<u>reversed()</u>	Returns a reversed iterator

**11. Booleans :-** Booleans represent one of two values i.e., True or False

a. `print(bool("Hello"))`  
`print(bool(15))`

OUTPUT:

True

True

```
print(bool("Hello"))
print(bool(15))

arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun/.vscode/extension
un.py
True
True
arun@Dell-Inspiron-14-5430:~$
```

Note:

1. Almost any value is evaluated to `True` if it has some sort of content.
2. Any string is `True`, except empty strings.
3. Any number is `True`, except 0.
4. Any list, tuple, set, and dictionary are `True`, except empty ones.

**12. Lists :** are used to store multiple items in a single variable. List is ordered, changeable and allow duplicate values.

```
mylist = ["apple", "banana", "cherry", "apple"]
```

a. To find length → `len(myList)`

```
thislist = ["apple", "banana", "cherry"]
print(len(thislist))
```

b. **List Constructor** to make a new list

```
thislist = list(("apple", "banana", "cherry"))
```

```
print(thislist)
```

**OUTPUT:**

```
["apple", "banana", "cherry"]
```

```
thislist = list(("apple", "banana", "cherry"))
print(thislist)
|
```

```
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun/.vscode/extension
un.py
['apple', 'banana', 'cherry']
arun@Dell-Inspiron-14-5430:~$
```

### 13. Python List Slicing

Syntax: List[ Initial : End : IndexJump ]

- a. Positive Index: **0** →
- b. Negative Index: **-1 from last**

```
Lst = [50,70,30,30,90,10,50]

#Display list
print(Lst[-7::1])
```

```
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun/.vscode/extension
un.py
[50, 70, 30, 30, 90, 10, 50]
arun@Dell-Inspiron-14-5430:~$
```

- a. # Initialize list  
`List = [1, 2, 3, 4, 5, 6, 7, 8, 9]`

```
# Show original list
print("Original List:\n", List)
```

```
print("\nSliced Lists: ")
```

```
# Display sliced list
print(List[3:9:2])
```

```
# Display sliced list
print(List[::2])
```

```
# Display sliced list
print(List[::2])
```

**OUTPUT:**

Original List:

```
[1, 2, 3, 4, 5, 6, 7, 8, 9]
```

Sliced Lists:

```
[4, 6, 8]
```

```
[1, 3, 5, 7, 9]
```

```
[1, 2, 3, 4, 5, 6, 7, 8, 9]
```

```
137 # Initialize list
138 List = [1, 2, 3, 4, 5, 6, 7, 8, 9]
139
140 # Show original list
141 print("Original List:\n", List)
142
143 print("\nSliced Lists: ")
144
145 # Display sliced list
146 print(List[3:9:2])
147
148 # Display sliced list
149 print(List[::2])
150
151 # Display sliced list
152 print(List[::])
```

```
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun/.vscode/extensions/
un.py
Original List:
[1, 2, 3, 4, 5, 6, 7, 8, 9]

Sliced Lists:
[4, 6, 8]
[1, 3, 5, 7, 9]
[1, 2, 3, 4, 5, 6, 7, 8, 9]
arun@Dell-Inspiron-14-5430:~$
```

14. **Matrix:** A matrix is a collection of numbers arranged in a rectangular array in rows and columns.

```
a. matrix = [[1, 2, 3, 4],
              [5, 6, 7, 8],
              [9, 10, 11, 12]]
```

```
print("Matrix =", matrix)
```

**OUTPUT:**

```
Matrix = [[1, 2, 3, 4], [5, 6, 7, 8], [9, 10, 11, 12]]
```

```
154 matrix = [[1, 2, 3, 4],
155            [5, 6, 7, 8],
156            [9, 10, 11, 12]]
157
158
159 print("Matrix =", matrix)
```

```
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /h
un.py
Matrix = [[1, 2, 3, 4], [5, 6, 7, 8], [9, 10, 11, 12]]
arun@Dell-Inspiron-14-5430:~$
```

## 15. List Methods:

### List Methods in Python

S.no	Method	Description
1	<a href="#">append()</a>	Used for appending and adding elements to the end of the List.
2	<a href="#">copy()</a>	It returns a shallow copy of a list
3	<a href="#">clear()</a>	This method is used for removing all items from the list.
4	<a href="#">count()</a>	These methods count the elements
5	<a href="#">extend()</a>	Adds each element of the iterable to the end of the List
6	<a href="#">index()</a>	Returns the lowest index where the element appears.
7	<a href="#">insert()</a>	Inserts a given element at a given index in a list.
8	<a href="#">pop()</a>	Removes and returns the last value from the List or the given index value.
9	<a href="#">remove()</a>	Removes a given object from the List.
10	<a href="#">reverse()</a>	Reverses objects of the List in place.
11	<a href="#">sort()</a>	Sort a List in ascending, descending, or user-defined order
12	<a href="#">min()</a>	Calculates the minimum of all the elements of the List
13	<a href="#">max()</a>	Calculates the maximum of all the elements of the List

```

#my_list

my_list = ['geeks', 'for']

#Add geeks to the list

my_list.append('geeks')
print(my_list)

```

```

matrix = [[1, 2, 3, 4], [5, 6, 7, 8], [9, 10, 11, 12]]
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun/un.py
['geeks', 'for', 'geeks']
arun@Dell-Inspiron-14-5430:~$

```

## 16. Packing and Unpacking

- a. # A sample function that takes 4 arguments

```

# and prints the,
def fun(a, b, c, d):
    print(a, b, c, d)

```

```

# Driver Code

```

```

my_list = [1, 2, 3, 4]

```

```

# Unpacking list into four arguments

```

```

fun(*my_list)

```

OUTPUT:

```

(1, 2, 3, 4)

```

```

# A sample function that takes 4 arguments
# and prints the,
def fun(a, b, c, d):
    print(a, b, c, d)

# Driver Code
my_list = [1, 2, 3, 4]

# Unpacking list into four arguments
fun(*my_list)

```

```

arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /h
un.py
1 2 3 4
arun@Dell-Inspiron-14-5430:~$

```

1. **Packing:** When we don't know how many arguments need to be passed to a python function, we can use Packing to pack all arguments in a tuple.

- a. 

```

# A Python program to demonstrate use of packing
# This function uses packing to sum unknown number of arguments
def mySum(*args):
    return sum(args)

# Driver code
print(mySum(1, 2, 3, 4, 5))
print(mySum(10, 20))

```

**OUTPUT:**

```

15
30

```

```

182 def mySum(*args):
183     return sum(args)
184
185 # Driver code
186 print(mySum(1, 2, 3, 4, 5))
187 print(mySum(10, 20))

```

```

arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /h
un.py
15
30
arun@Dell-Inspiron-14-5430:~$

```

17. **None:-** None is used to define a null value or Null object in Python. It is not the same as an empty string, a False, or a zero. It is a data type of the class NoneType object.

```
a. def check_return():  
    pass  
    print(check_return())
```

**OUTPUT:** None

```
189 def check_return():  
190     pass  
191     print(check_return())  
192
```

```
30  
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun/arun.py  
None  
arun@Dell-Inspiron-14-5430:~$
```

```
b. print(type(None))  
  
    print(type(Null))
```

**OUTPUT:**

<class 'NoneType'>

NameError -> **As there is no Null in Python**

```
192  
193 print(type(None))  
194 print(type(Null))  
195
```

```
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun/arun.py  
<class 'NoneType'>  
Traceback (most recent call last):  
  File "/home/arun/arun.py", line 194, in <module>  
    print(type(Null))  
NameError: name 'Null' is not defined  
arun@Dell-Inspiron-14-5430:~$
```

c. **Note:** If a function does not return anything, it returns None in Python.

18. **Dictionary in Python** is a collection of keys values, used to store data values like a map.

a. `Dict = {1: 'Geeks', 2: 'For', 3: 'Geeks'}`  
`print(Dict)`

OUTPUT:

```
{1: 'Geeks', 2: 'For', 3: 'Geeks'}
```

```
197 Dict = {1: 'Geeks', 2: 'For', 3: 'Geeks'}
198 print(Dict)
199 |
```

```
NameError: name Dict is not defined
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /ho
un.py
{1: 'Geeks', 2: 'For', 3: 'Geeks'}
arun@Dell-Inspiron-14-5430:~$
```

b. `# Creating a Dictionary with Integer Keys`  
`Dict = {1: 'Geeks', 2: 'For', 3: 'Geeks'}`  
`print("\nDictionary with the use of Integer Keys: ")`  
`print(Dict)`  
  
`# Creating a Dictionary with Mixed keys`  
`Dict = {'Name': 'Geeks', 1: [1, 2, 3, 4]}`  
`print("\nDictionary with the use of Mixed Keys: ")`  
`print(Dict)`

OUTPUT:

```
Dictionary with the use of Integer Keys:
{1: 'Geeks', 2: 'For', 3: 'Geeks'}
Dictionary with the use of Mixed Keys:
{'Name': 'Geeks', 1: [1, 2, 3, 4]}
```

```

201 # Creating a Dictionary with Integer Keys
202 Dict = {1: 'Geeks', 2: 'For', 3: 'Geeks'}
203 print("\nDictionary with the use of Integer Keys: ")
204 print(Dict)
205
206 # Creating a Dictionary with Mixed keys
207 Dict = {'Name': 'Geeks', 1: [1, 2, 3, 4]}
208 print("\nDictionary with the use of Mixed Keys: ")
209 print(Dict)

```

```

arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun/un.py

```

```

Dictionary with the use of Integer Keys:
{1: 'Geeks', 2: 'For', 3: 'Geeks'}

```

```

Dictionary with the use of Mixed Keys:
{'Name': 'Geeks', 1: [1, 2, 3, 4]}

```

```

arun@Dell-Inspiron-14-5430:~$

```

c. # Creating a Dictionary

```
Dict = {1: 'Geeks', 'name': 'For', 3: 'Geeks'}
```

```
# accessing a element using key
```

```
print("Accessing a element using key:")
```

```
print(Dict['name'])
```

```
# accessing a element using key
```

```
print("Accessing a element using key:")
```

```
print(Dict[1])
```

**OUTPUT:**

```
Accessing a element using key:
```

```
For
```

```
Accessing a element using key:
```

```
Geeks
```

```

212 # Creating a Dictionary
213 Dict = {1: 'Geeks', 'name': 'For', 3: 'Geeks'}
214
215 # accessing a element using key
216 print("Accessing a element using key:")
217 print(Dict['name'])
218
219 # accessing a element using key
220 print("Accessing a element using key:")
221 print(Dict[1])

```

```

{'Name': 'Geeks', 1: [1, 2, 3, 4]}
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /ho
un.py
Accessing a element using key:
For
Accessing a element using key:
Geeks
arun@Dell-Inspiron-14-5430:~$

```

#### d. DELETING

```

# Creating a Dictionary
Dict = {1: 'Geeks', 'name': 'For', 3: 'Geeks'}

print("Dictionary =")
print(Dict)
#Deleting some of the Dictionar data
del(Dict[1])
print("Data after deletion Dictionary=")
print(Dict)

```

##### OUTPUT:

```

Dictionary ={1: 'Geeks', 'name': 'For', 3: 'Geeks'}
Data after deletion Dictionary={'name': 'For', 3: 'Geeks'}

```

```

223 # Creating a Dictionary
224 Dict = {1: 'Geeks', 'name': 'For', 3: 'Geeks'}
225
226 print("Dictionary =")
227 print(Dict)
228 #Deleting some of the Dictioanr data
229 del(Dict[1])
230 print("Data after deletion Dictionary=")
231 print(Dict)

```

```

arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /ho
un.py
Dictionary =
{1: 'Geeks', 'name': 'For', 3: 'Geeks'}
Data after deletion Dictionary=
{'name': 'For', 3: 'Geeks'}
arun@Dell-Inspiron-14-5430:~$

```

## 19. Dictionary Methods:

### Dictionary methods

Method	Description
dic.clear()	Remove all the elements from the dictionary
dict.copy()	Returns a copy of the dictionary
dict.get(key, default = "None")	Returns the value of specified key
dict.items()	Returns a list containing a tuple for each key value pair
dict.keys()	Returns a list containing dictionary's keys
dict.update(dict2)	Updates dictionary with specified key-value pairs
dict.values()	Returns a list of all the values of dictionary
pop()	Remove the element with specified key
popitem()	Removes the last inserted key-value pair
dict.setdefault(key,default="None")	set the key to the default value if the key is not specified in the dictionary
dict.has_key(key)	returns true if the dictionary contains the specified key.
dict.get(key, default = "None")	used to get the value specified for the passed key.

**20. Tuple:** Python Tuple is a collection of objects separated by commas.

a. 

```
var = ("Geeks", "for", "Geeks")  
print(var)
```

**Output:**

`("Geeks", "for", "Geeks")`

```
233 var = ("Geeks", "for", "Geeks")  
234 print(var)  
235 |
```

```
{ name : 'for', s: 'Geeks' }  
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun.py  
( 'Geeks', 'for', 'Geeks' )  
arun@Dell-Inspiron-14-5430:~$
```

b. 

```
values : tuple[int | str, ...] = (1,2,4,"Geek")  
print(values)
```

**Output:**

`(1, 2, 4, 'Geek')`

Here, in the above snippet we are considering a variable called values which holds a tuple that consists of either int or str, the ‘...’ means that the tuple will hold more than one int or str.

```
236 values : tuple[int | str, ...] = (1,2,4,"Geek")  
237 print(values)  
238
```

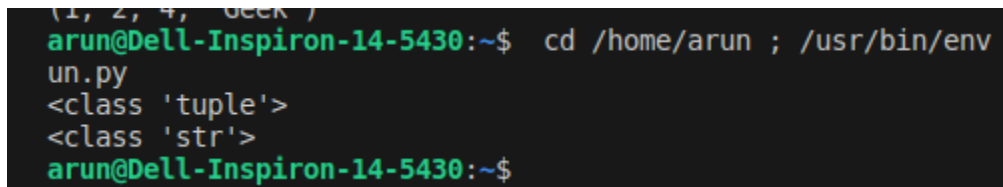

```
IndentationError: unexpected indent  
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun.py  
(1, 2, 4, 'Geek')  
arun@Dell-Inspiron-14-5430:~$
```

```
c.mytuple = ("Geeks",)
print(type(mytuple))
```

```
#NOT a tuple
mytuple = ("Geeks")
print(type(mytuple))
```

**OUTPUT:**

```
<class 'tuple'>
<class 'str'>
```

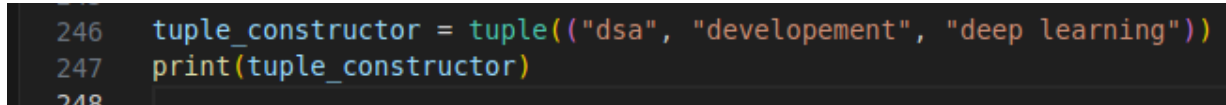

```
(1, 2, 4, 'Geek')
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env
un.py
<class 'tuple'>
<class 'str'>
arun@Dell-Inspiron-14-5430:~$
```

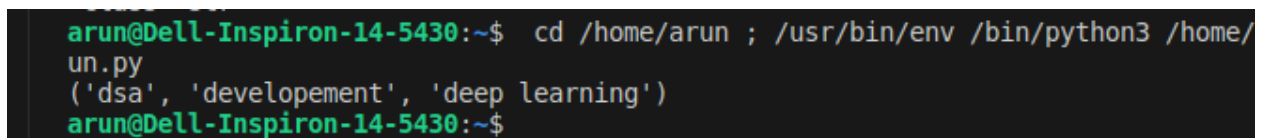

```
d.tuple_constructor = tuple(("dsa", "developement", "deep
learning"))
print(tuple_constructor)
```

**OUTPUT:**

```
('dsa', 'developement', 'deep learning')
```

```
246 tuple_constructor = tuple(("dsa", "developement", "deep learning"))
247 print(tuple_constructor)
248
```

```
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/
un.py
('dsa', 'developement', 'deep learning')
arun@Dell-Inspiron-14-5430:~$
```

**21. Sets:** is an unordered collection data type that is iterable, mutable and has no duplicate elements

```
a. var = {"Geeks", "for", "Geeks"}
print(type(var))
```

**OUTPUT:** Set

```

250 var = {"Geeks", "for", "Geeks"}
251 print(type(var))
252

```

```

arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun.py
<class 'set'>
arun@Dell-Inspiron-14-5430:~$

```

```

b. myset = set(["a", "b", "c"])
   print(myset)

```

```

myset.add("d")
print(myset)

```

**OUTPUT:**

```

{'c', 'b', 'a'}
{'d', 'c', 'b', 'a'}

```

```

253 myset = set(["a", "b", "c"])
254 print(myset)
255
256
257
258 myset.add("d")
259 print(myset)

```

```

<class 'set'>
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun.py
{'a', 'c', 'b'}
{'a', 'd', 'c', 'b'}
arun@Dell-Inspiron-14-5430:~$

```

```

c. myset = {"Geeks", "for", "Geeks"}
   print(myset)

```

```

myset[1] = "Hello"
print(myset)

```

**OUTPUT:**

```

{'Geeks', 'for'}

```

```

TypeError: 'set' object does not support item assignment

```

```

261 myset = {"Geeks", "for", "Geeks"}
262 print(myset)
263
264 myset[1] = "Hello"
265 print(myset)

```

```

Traceback (most recent call last):
  File "/home/arun/arun.py", line 264, in <module>
    myset[1] = "Hello"
TypeError: 'set' object does not support item assignment
arun@Dell-Inspiron-14-5430:~$

```

```

D. people = {"Jay", "Idrish", "Archi"}
   people.add("Daxit")
   print(people)

```

**OUTPUT:** {"Jay", "Idrish", "Archi", "Daxit"} → IN ANY ORDER

```

268 people = {"Jay", "Idrish", "Archi"}
269 people.add("Daxit")
270 print(people)
271

```

```

arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home,
un.py
{'Archi', 'Daxit', 'Jay', 'Idrish'}
arun@Dell-Inspiron-14-5430:~$

```

E. Adding two two sets using **UNION**

```

people = {"Jay", "Idrish", "Archil"}
vampires = {"Karan", "Arjun"}
dracula = {"Deepanshu", "Raju"}

population = people.union(vampires)

print("Union using union() function")
print(population)

population = people|dracula

print("\nUnion using '|' operator")

```

```
print(population)
```

**OUTPUT:**

Union using union() function

```
{'Karan', 'Idrish', 'Jay', 'Arjun', 'Archil'}
```

Union using '|' operator

```
{'Deepanshu', 'Idrish', 'Jay', 'Raju', 'Archil'}
```

```
273 people = {"Jay", "Idrish", "Archil"}
274 vampires = {"Karan", "Arjun"}
275 dracula = {"Deepanshu", "Raju"}
276
277 population = people.union(vampires)
278
279 print("Union using union() function")
280 print(population)
281
282 population = people|dracula
283
284 print("\nUnion using '|' operator")
285 print(population)
```

```
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home
un.py
Union using union() function
{'Jay', 'Karan', 'Idrish', 'Arjun', 'Archil'}

Union using '|' operator
{'Jay', 'Deepanshu', 'Raju', 'Idrish', 'Archil'}
arun@Dell-Inspiron-14-5430:~$
```

## F. Selecting Common Elements

```
set1 = set()
set2 = set()
set3 = set1.intersection(set2)
print(set3)
set3 = set1 & set2
print(set3)
```

**OUTPUT:**

```
{1, 2, 3}
```

```
{1, 2, 3}
```

```

288 set1 = {1,2,3}
289 set2 = [1,2,3]
290 set3 = set1.intersection(set2)
291 print(set3)
292 set3 = set1 & set2
293 print(set3)
294
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun/un.py
{1, 2, 3}
{1, 2, 3}
arun@Dell-Inspiron-14-5430:~$

```

G. Clearing a set

```

set1 = {1,2,3,4,5,6}
set1.clear()
print(set1)

```

**OUTPUT:** set()

```

295 set1 = {1,2,3,4,5,6}
296 set1.clear()
297 print(set1)
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun/un.py
set()
arun@Dell-Inspiron-14-5430:~$

```

## 22. If-Else-Elif Statement :

Python supports the usual logical conditions from mathematics:

- Equals: `a == b`
- Not Equals: `a != b`
- Less than: `a < b`
- Less than or equal to: `a <= b`
- Greater than: `a > b`
- Greater than or equal to: `a >= b`

a. `a = 33`

```

b = 200
if b > a:
    print("b is greater than a")

```

**OUTPUT:** b is greater than a

```

301 a = 33
302 b = 200
303 if b > a:
304     print("b is greater than a")
305
IndentationError: expected an indented block after 'if' statement on line 303
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun.py
b is greater than a
arun@Dell-Inspiron-14-5430:~$

```

b.

```

a = 200
b = 33
if b > a:
    print("b is greater than a")
elif a == b:
    print("a and b are equal")
else:
    print("a is greater than b")

```

**OUTPUT:** a is greater than b

```

307 a = 200
308 b = 33
309 if b > a:
310     print("b is greater than a")
311 elif a == b:
312     print("a and b are equal")
313 else:
314     print("a is greater than b")
315
IndentationError: unexpected indent
arun@Dell-Inspiron-14-5430:~$ cd /home/arun ; /usr/bin/env /bin/python3 /home/arun.py
a is greater than b
arun@Dell-Inspiron-14-5430:~$

```

**C. AND**

```
a = 200
b = 33
c = 500
if a > b and c > a:
    print("Both conditions are True")
```

OUTPUT: Both conditions are True

**D. OR**

```
a = 200
b = 33
c = 500
if a > b or a > c:
    print("At least one of the conditions is True")
```

OUTPUT: At least one of the conditions is True

**E. NOT**

```
a = 33
b = 200
if not a > b:
    print("a is NOT greater than b")
```

OUTPUT: a is NOT greater than b

**F. Pass** → **if** statements cannot be empty, but if you for some reason have an **if** statement with no content, put in the **pass** statement to avoid getting an error.

**23. Truthly Vs Falsely:** In Python, individual values can evaluate to either True or False. They do not necessarily have to be part of a larger expression to evaluate to a truth value because they already have one that has been determined by the rules of the Python language.

The basic rules are:

- Values that evaluate to False are considered Falsy. (0, None, Empty)
- Values that evaluate to True are considered Truthy.

**24. Ternary Operator :** The ternary operator in Python is simply a shorter way of writing an if and if...else statement

- a. `a, b = 10, 20`  
`min = a if a < b else b`  
`print(min)`  
OUTPUT: 10
- b. `a, b = 10, 20`  
`print ("Both a and b are equal" if a == b else "a is greater than b"`  
`if a > b else "b is greater than a")`  
  
OUTPUT:b is greater than a

**25. Short Circuiting Techniques:** mean the stoppage of execution of boolean operation if the truth value of expression has been determined already.

—> An expression containing **and or** stops execution when the truth value of expression has been achieved. Evaluation takes place from left to right.

- a. **X or Y** —> Y is executed only if X is false else if X is true, X is result.
- b. **X and Y** —> Y is executed only if X is true, else if X is false, X is result.
- c. **Not X** —> not has lower priority than non-booleans.
